### **Question - Frictional Forces and Motion – with answers**

A child pulls on a rope as shown and the chest accelerates across the horizontal floor at 0.456 metres per second squared.

The toy chest and its contents have a mass of 18.4 kilograms and the coefficient of kinetic friction between the chest and the floor is 0.420. The angle  $\theta = 42.0^\circ$ .

What is the magnitude of the tension force that the child must exert on the rope to cause this acceleration?

Ignore the dimensions of the box. Treat it like a particle.

### Answers

net force =  $ma = 18.4 \text{ kg} \times 0.456 \text{ m/s}^2 = 8.3904 \text{ newtons}$  to the right (1 mark)

weight =  $mg = 18.4 \times 9.81 = 180.504 \text{ N}$  down

Take "T" to be the tension force

Friction force =  $\mu \times \text{normal force} = 0.420 \times \text{normal force}$

Assume up is positive and to the right is positive

Vertical direction  $T \sin \theta + \text{normal force} = mg = 180.504 \text{ N}$

Horizontal direction  $T \cos \theta - \text{friction force} = ma = 8.3904 \text{ N}$

So there are two simultaneous equations with two unknowns

$$T \sin \theta + \text{normal force} = 180.504 \text{ N}$$

$$T \cos \theta - 0.420 \text{ normal force} = 8.3904 \text{ N}$$

Solving gives  $T = \text{Tension force} = 82.3777 = 82.4 \text{ N}$

$$\text{Normal force} = 125.5 \text{ N}$$

Marking notes: 3/6=9 marks if assumed the normal force =  $mg$  so  $T=113\text{N}$

1/9 if assumed normal force =  $m g \cos \theta$ . Not an incline

Details for the solution. I use substitution

$$T \sin \theta + \text{normal force} = 180.504 \text{ N}$$

$$T \times 0.6991306 + \text{normal} = 180.504$$

$$\text{So normal force} = 180.504 - (T \times 0.6991306)$$

$$T \cos \theta - 0.420 \text{ normal force} = 8.3904 \text{ N}$$

$$T \times 0.743144 - 0.420 \text{ normal force} = 8.3904 \text{ N}$$

So using substitution

$$\{T \times 0.74314\} - \{0.420 \times (180.504 - (T \times 0.6991306))\} = 8.3904 \text{ N}$$

$$\{T \times 0.74314\} - \{75.826 - T \times 0.28103\} = 8.3904$$

$$T \times 1.0241 = + 84.216 \text{ N}$$

$$T = 82.234 = 82.2 \text{ N}$$

Not needed, but normal force = 125.5 N

0/6 marks if assumed the normal force =  $mg$
