Pros:

- Good for writing formulas
- Allows focus on structure, rather than formatting
- Good for cross-references and citations
- Visually impressive documents
- PDF output — no updates on printing

Cons:

- Larger initial time investment
- Awkward table creation mechanism
- Paradigm works against you if you're interested in implementing a specific format
- Can be harder to track changes between versions of a document

- ① Document structure coded in a `.tex` source file
 - Plain text file; can be modified using any editor
 - Formatting is accounted for by a single statement at the beginning of the document
- ② Source file compiled to a `.dvi` or `.pdf` file
 - `.pdf` files are typically the final product

① The \LaTeX compiler

- Contains all the fundamental functionality for converting `.tex` files to `.dvi` or `.pdf` files

② Package Extensions

- Add new functionality to \LaTeX or change existing options

③ A \LaTeX Editor

- Provides a good environment for editing `.tex` files
 - Autocompletion of recognized commands
 - Simple interface for compiling and viewing documents

Not Printed from Source		L ^A T _E X Code	
“	(opening double quote)	``	(two grave accents)
”	(closing double quote)	''	(two apostrophes)
—	(em dash)	---	(three hypens)

In addition, the characters $<$ and $>$ will only display in math mode

Default Classes (installed with the compiler)

- `article`: for scientific articles
- `report`: for longer reports containing chapters (e.g. theses)
- `book`: for long documents; similar to `report`, but contains `frontmatter`, `mainmatter`, and `backmatter` and does not contain an `abstract` environment
- `letter`: for letters
- `beamer`: for slideshows (like this one!)
 - Note: the L^AT_EX-vs-alternatives comparison is less favourable for presentations (L^AT_EX presentations are about as hard to prepare as PowerPoint presentations)

Running Header

6.3 Mechanical Boundary Work

(1) Simple Case

In the simple case, all forces are normal to moving boundaries (no shear) and the internal pressure is uniform. Then

1. Infinitesimal Form

$$\delta W_{b,out} = P dV \quad (18)$$

2. Rate Form

$$\dot{W}_{b,out} = P \frac{d}{dt} V \quad (19)$$

3. Integrated Forms

$$W_{b,out} = \int_1^2 P(V) dV \quad (20)$$

$$W_{b,out} = \int_{t_1}^{t_2} P(t) \frac{dV}{dt} (t) dt$$

(2) General Case

In the general case, the system is subject to arbitrarily-directed outward-pointing surface forces \vec{F} which may vary over the boundary surface.

1. Infinitesimal Form

$$\delta W_{b,out} = \int_{\text{boundary}} (\vec{F} \cdot d\vec{x}) \quad (21)$$

... where $d\vec{x}$ is the infinitesimal displacement of the boundary element dA

2. Rate Form

$$\dot{W}_{b,out} = \int_{\text{boundary}} (\vec{F} \cdot d\vec{v}) \quad (22)$$

... where $d\vec{v}$ is the velocity of the boundary element dA

3. Integrated Form

$$W_{b,out} = \int_1^2 \int_{\text{boundary}} (\vec{F} \cdot d\vec{x}) \quad (23)$$

... where $d\vec{v}$ is the velocity of the boundary element dA

Table creation is probably the most tedious part of creating L^AT_EX documents, but fortunately there are plugins for spreadsheet programs which can convert a set of cells into L^AT_EX code:

- **For Microsoft Excel:** Excel2LaTeX (<http://www.ctan.org/tex-archive/support/excel2latex/>)
- **For OpenOffice Calc:** Calc2LaTeX (<http://calc2latex.sourceforge.net/>)

It's fairly straightforward to tweak things like

- which section levels appear in the Table of Contents
- the numeral style (arabic, roman, alphabetic)
- the numbering scheme (e.g. number figures within sections: 1-1, 1-2, ...; 2-1, 2-2, ...)

- The L^AT_EX Wikibook (<http://en.wikibooks.org/wiki/LaTeX>) has a great overview of pretty much everything
- Googling “Latex [what you’re trying to do]” will typically direct you to a forum where someone has already asked your exact question and received several answers.
 - TeX Stack Exchange (<http://tex.stackexchange.com/>) will probably be a frequent top hit. You can also ask your own questions on the site if they aren’t already answered
- Most packages come with a manual file named [packagename].pdf
- <http://detexify.kirelabs.org/classify.html> — draw a symbol and the website will tell you how to code it in L^AT_EX

- Not all levels appear in the Table of Contents. The deepest level to appear can be changed by modifying the counter `tocdepth`; for example, to make only sections appear:

```
\setcounter{tocdepth}{1}
```

- Each sectioning command has a corresponding “starred” version (e.g. `\section*{}`) which creates a heading but does not number it or place it in the Table of Contents
- Items which are not inserted into the Table of Contents by default can be added using

```
\addcontentsline{[table]}{[sectionname]}{[title]}  
[table] = toc, lof, or lot  
[sectionname] = part, chapter, section...  
[title] is the text of the entry (e.g. “References”)
```

Automatic breaking at words

- \LaTeX is generally good at identifying acceptable hyphenation points in English words
- If \LaTeX has difficulty, the code `\-` can be inserted within a word to indicate that \LaTeX may break the word at this location if necessary (e.g. `man\ -u\ -script`). This has no impact if the word falls in the middle of a line.

Breaking at spaces

- The tilde (`~`) represents a non-breaking space

Breaking at slashes

- The slash literal (`/`) is never used as a line break point
- The \LaTeX code `\slash` is a slash which is allowed to be used as a line break point

Inter-Word vs. Inter-Sentence Spacing

L^AT_EX usually treats any combination of whitespace characters as identical to a single space; the size of the space inserted is determined by context:

- Default: inter-word (standard) space
- Following a period: inter-sentence space (slightly larger)
 - *unless* the character before the space is a capital letter (typically indicating an initial or initialism)

In corner cases, this will be wrong:

- Lower-case short forms (such as “vs.”) are treated as the end of a sentence. In this corner case the escaped space (`\`) can be used to force an inter-word space
- Words which end in capitals are treated as initials if they fall at the end of a sentence (e.g. “...with NASA.”). In this corner case using the escaped period (`\@.`) can be used to indicate that a sentence has ended

Professional typesetters actually makes a distinction between different varieties of dashes:

Character	Name	Code	Usage
—	Minus Sign	\$-\$	in math environments
-	Hyphen	-	within words
-	en (n) dash	--	within ranges (eg. pages 4–27)
—	em (m) dash	---	interruption within a sentence

(The en and em dash are so called because their widths are comparable to the widths of those letters)
