

20-R-VIB-DY-26 Beginner

A box of mass $m = 5\frac{kg}{11}$ is connected to a spring, $k = 200\text{N/m}$ on the wall. The ground has a friction coefficient of $\mu = 0.2$. Given an initial displacement of 0.1 m ,

$F_f > F_k$ at stop

$$x(t) = \left(x_0 - \frac{(2n-1)\mu mg}{k}\right) \cos \omega_n t + \frac{\mu mg}{k} (-1)^{(n+1)}$$

$n = \text{every half period}$

has to stop at peak

because $f_{\text{static}} > f_{\text{kinetic}}$

$$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{40}$$

$$\mu mg > kx(t)$$

$$\frac{\mu mg}{k} > \left(x_0 - \frac{(2n-1)\mu mg}{k}\right) \cos \omega_n t + \frac{\mu mg}{k} (-1)^{(n+1)}$$

$$0.04905 > (0.1 - 0.04905(2n-1)) \cos \sqrt{40} t + 0.04905 (-1)^{(n+1)}$$

$$n=1, \quad \dot{x}(t) = 0.0019$$

$$n=2, \quad \underline{x(t) = 0.0962}$$

$$n=2 - \sqrt{40}t = 2\pi \quad t = \frac{\sqrt{40}}{2\pi}$$

one full
period, 2π
